MyZion

SPECIALIST SUPPORT THAT DOESN'T END WHEN THE SESSION DOES

MyZion — technology that helps the specialist deliver treatment between sessions.

THE PROBLEM

BETWEEN SESSIONS, THE PATIENT IS ON THEIR OWN

>1 bn people live with mental health conditions

13 mental health workers per 100,000 people — global median

WHO, 2020, and the specialist looks the time and energy to fix these always

WHAT IT IS

MYZION CONTINUES THERAPY BETWEEN SESSIONS

The specialist sets the words and tasks. The patient does them in a personal room next to the specialist's avatar. Before the session, the specialist sees a summary. We start with CBT, DBT and ACT — a combination of therapy, not a replacement.

MISSION AND VALUES

TREATMENT MORE ACCESSIBLE, EFFECTIVE AND SAFER

Six values MyZion is built on.

01 Availability
Text, voice, image, voice and words, and rewards with a personal message, you with the patient between sessions. Support does not end with the session, and specialists see how. We'll reports % per SECOND

02 Effectiveness
Work with the patient through tasks between sessions. Homework guidance and a strong bond, diaries, norms and rewards are built to strengthen all three Hypothesis

03 Safety
Both sides are protected. Interactions are recorded for a dispute or force majeure, a real warning to the bots behind the avatar. SOS leads to real people, crowds. Data is stored on the user's device and in the cloud, with no working mechanism reviews a patient in a vulnerable moment.

04 Boundaries
Built on the alliance, because the specialist's health matters as much as the patient's. The answer switches off in one click. Clear messages are thereof and threats of violence are not the reasons' decisions. If a patient

05 Less routine
Less routine for specialists and patients, so more time for what matters. Less anxiety for both specialist and patient. Less anxiety for both specialist and patient. Less anxiety for both specialist and patient.

06 AI never replaces the specialist
AI is a tool in the specialist's hands. It doesn't make it a SUB. Language models acting as therapists showed slights and inappropriate replies (Moore 2025), and

Effectiveness is a hypothesis. Clear filtering and flagging of all bots against the specialist are part of the first version.

ROOM

THE ROOM GROWS WITH THE PATIENT

A personal space the patient returns to between sessions.

01 Every step adds something
A completed task, a diary entry, a voice reflection — the room grows with what is done.

02 The specialist's work inside
the specialist's avatar appears in the room at key moments and carries words the specialist recorded, rewards for progress arrive with their personal message.

03 Voice and diary
Voice entries with the specialist's questions, the diary opens to the specialist only at the patient's decision.

04 Rewards — with caution
evidence on gains elements or even (Ward 09 2021, Kaufmann 2024), set the room is built around progress and feedback, not completion.

Basis: CBT homework (g=+.1.40 in controlled studies (Kazantzis et al., 2016; CBT data, not MyZion). The effect will be the same effect.

DATA

DATA INTERPRETATION AND ANALYSIS — SUPPORT, NOT DIAGNOSIS

It tells of clients deteriorate, and therapists often do not see it (Lambert & Shimokawa, 2011). MyZion assembles the picture for the specialist, not the diagnosis.

01 Summary before the session - Stage A
one map: the patient's theme, its task completion and what they chose to share

02 Marker words and topics - Stage A
the specialist sees what to watch for.

03 Wearable trends - Stage B
Aggregation of biometry data for the specialist.

04 Patient diagram - Stage B
analysis of pattern data in diagrammatic the specialist. It is not a diagnosis.

Stage A is available to regulatory approvals (MHRA). The first Stage Stage B is not a medical device.

CONTROL

BOUNDARIES AND ALLIANCE UNDER CONTROL

Burnout is linked to working hours and "interpressure" — the urge to respond immediately (Sayer 2024, Kotera 2021).

01 Availability windows
the specialist sets when they are available. Outside the window the avatar carries only pre-prepared words.

02 "Online" or "prepared" presence
the patient sees whether the specialist is available or they are their prepared words.

03 Off in one step
the avatar switches off with one action.

04 Records for a dispute
Every interaction is recorded in a dispute or force majeure situation, evidence scenes.

05 Filtering rules
Words and topics that the specialist wants to see first.

06 Less routine
Routine messages are set once, expert for supervision.

07 Messages and threats
Filtering of messages and flagging of threats against the specialist and the first user.

Where records are stored and who can access them will be stated in the privacy notice before the pilot. Built with UK GDPR in mind.

THE FIRST PATIENT

PATIENT SAFETY

MyZion is not an emergency service and does not replace the specialist.

01 Knows who is behind the avatar
a real specialist stands behind it, the avatar carries only their words.

02 SOS leads to people
the SOS button always leads to real emergency contacts, in a crisis the avatar does not replace the specialist.

03 Own voice, own image
we do not clone the patient's voice or change their avatar's figure.

04 Consent — separately
For each kind of data, the specialist sees only what the patient chose to open.

CHANNELS

THE AVATAR CARRIES THE SPECIALIST'S OWN WORDS

Three forms — the specialist's choice, not an algorithm. They write or approve every phrase.

01 Digital avatar
from a face scan, stylized, not photorealistic a photorealism one caused more anxiety and less self-disclosure (Baumeister 2008). For those who value a bond with a specific person.

02 Sphere
If you do not want to show your face or fans cause tension, calm, neutral presence.

03 No digital avatar
support through text, voice and tasks without a visual layer.

This is not a comparison of "with" and "without" an avatar. No price will end the effect.

ONE DAY

ONE DAY WITH MYZION

1 Specialist prepares
Sets a task and reports last week: voice diary

2 Patient does
Opens the room, does the task, records a voice diary

3 Specialist is near
The avatar runs the diary words at the right moment, the room grows with what is done

4 Specialist sees
Opens a summary before the session, what was done and what the patient chose to share

AI

AI SERVES THE SPECIALIST, NOT INSTEAD OF THEM

66.4% of ACP members worry about losing the human touch of recommendations

>53% of US counselors fully agree that AI can't replace human social isolation

~14 pp diagnostic accuracy in clinical trials of conversational AI among its author (not psychotherapy)

Every phrase and task is written or approved by the specialist. Nothing reaches the patient without their approval.

RACP, 2024 (1000 responses), Kim Hegemier, PLOS, 2026 (trial vs. MD.AI, 2026 (full text of this appendix.

DIFFERENCE

HOW WE DIFFER FROM EXISTING SOLUTIONS

A comparison with what already exists for between-session work: diary and protocol apps. Through CBT.

FEATURE	GUIDED AND APPS ON THE MARKET	THERAPEUTIC	MYZION
Structure between sessions	checklist, diary	Reflect / Plan / Continue (patient only)	protocols + triggers
Embodied presence (avatar, room)	usually no	not stated in its listing	yes
Voice reflection that responds to phrases	usually no	not stated in its listing	yes
Wearable data forms	usually no	not stated, no clinical claims	yes, Stage B

The market analysis focuses on the US and Europe and Russia. Through the internet based in the Asia-Pacific, Africa, Latin America, no specialist sources, no review or voice described. The Pacific cohorts shows intended features of guidance in the Asia-Pacific region and
