

// XIP FOR HEALTHCARE

Your operational truth is real. It's just scattered across **six systems**.

Scheduling, clinical records, billing, payroll and the spreadsheets in between: each one right on its own, none of them agreeing. XIP puts one intelligence layer over all of it, so you can ask a plain question and understand what's going on across the organization.

The lag is the problem

By the time visits, claims and cash reconcile, the month is over. Decisions get made on last month's picture.

Your staff already use AI

Often with patient and business data, on personal accounts, with no oversight and no audit trail.

The usual fix is too big

A platform replacement is a 12 to 18 month project, with clinical disruption you cannot afford.

// REVENUE CYCLE MANAGEMENT: WHERE CLAIMS GET STUCK

Service → Claim → Biller → Payer → Remit → Cash

Getting paid runs through outsourced billers, payers and intermediaries, and finding where a claim stands is detective work across systems. XIP follows service to cash across all of them and can tell you where things stand, in real time. Ask in plain language, from your phone, and know what's happening. **Works with the systems you have. Replaces none of them.**

// QUESTIONS IT ANSWERS ON DAY ONE

- Which payers are our biggest risk, and what is that exposure worth?
- How are visits turning into collections, and into cash?
- What does payroll look like against schedule over the next two weeks?
- What is our service volume, by site and provider, and where is it trending?
- What does it cost us to deliver care, by site, program and clinician?

HOW IT WORKS, AND HOW IT STARTS, ON THE NEXT PAGE →

// HOW IT WORKS: ONE LAYER ACROSS YOUR SYSTEMS

XIP sits over scheduling, clinical records, billing, payroll and accounting. Each system keeps doing its job. XIP is the intelligence across them: it follows service to cash end to end, answers questions, flags problems, and provides solutions. **It is an agentic system, not another dashboard. You don't assemble reports to find the problem. You ask.**

Scheduling

Clinical records

Billing & claims

Payers & billers

Payroll

Accounting

XIP · THE INTELLIGENCE LAYER ACROSS ALL OF THEM

// BUILT FOR HIPAA REALITIES: SAFE TO POINT AT PHI

XIP plugs into the identity system you already use (Microsoft 365 or Google). Every person and every AI agent works inside the permissions they already have, and every access is recorded. Minimum-necessary access is enforced by the platform, not a policy binder.

- ✓ Role-based access: minimum necessary, enforced
- ✓ Complete audit trail of every access and action
- ✓ PHI sealed, never used to train models
- ✓ Runs fully inside your environment if you require it

// HOW IT STARTS

// 01 · SOLVE

Start with the biggest problem

The revenue cycle, service to cash, visible in real time across every system that touches it.

// 02 · EXPAND

Take on the next ones

Payroll against schedule, payer risk, cost to deliver care. Each answer builds on the same foundation.

// 03 · GROW

Grow into the platform

More connected systems, more questions answered, at your pace.

Fixed scope, fixed price, evidence-gated. Each phase is proven before the next is scoped, and it is sold as modules: the first win doesn't require buying a platform.

// RUNNING IN PRODUCTION TODAY

A multi-site behavioral-health provider runs its day-to-day operations on this platform: payroll, payer risk, sessions-to-collections and cash position, on live, protected data.

// ALSO DEPLOYED

Another healthcare provider runs a fully hosted operations hub built on the same platform.
