## **Sancorganic promotes the transformation of the Spanish agri-food sector with new standards of sustainability and quality.**

*Sancorganic is developing its strategic plan for 2026-2028, which consolidates its commitment to organic farming and its ambition to lead organic pistachio production in Spain. The company, which has two farms located in Cebreros (Ávila) and Valdetorres de Jarama (Madrid), is moving towards an integrated production model that encompasses everything from agronomic management to final packaging. Its goal is to offer a premium product and contribute to raising the quality and sustainability standards of the national agri-food sector.*

The company manages over 500 hectares and has planted more than 100,000 pistachio trees, with a projection to reach 200,000 pistachio trees in the coming years. This growth is supported by its own industrial infrastructure — the processing plant in Valdetorres de Jarama — which began operations during the last campaign and has already allowed for the processing of the first 4,000 kilograms of premium organic pistachios from the Cebreros farm. Far from being an isolated milestone, this operational advance responds to a strategic vision that combines long-term planning, technological innovation, and a verifiable commitment to market trust.

### **Traceability and food safety as pillars of trust in Sancorganic**

Sancorganic's production model is structured around a fully integrated value chain: from soil care and drip irrigation management to receiving, shelling, drying, and packaging the product at its facilities in Valdetorres de Jarama. This vertical integration allows for rigorous control over every phase of the process, an essential condition to ensure the 360° traceability demanded by the certified organic market.

Certified organic production introduces an additional level of requirement regarding food safety. Each batch is subject to the applicable European Union regulations for organic products, which involves periodic audits, quality control protocols, and obtaining the corresponding certifications. These mechanisms are not merely regulatory requirements but are part of the unique value that the company offers to its customers and business partners.

"We understand quality as the result of doing things right from the start: caring for the soil, using water with maximum efficiency, respecting natural cycles, and making decisions based on knowledge, data, and experience," state the team responsible for Sancorganic's operations.

Transparency in production processes is, in this sense, a structural condition of the business. The ecological nature of production and the complete traceability of the product create a foundation of trust towards distributors, the food industry, and the end consumer that is difficult to build without a verifiable industrial infrastructure.

### **Commitment to the circular economy in Spain**

Sancorganic integrates a set of practices into its agro-industrial model aimed at more efficient and environmentally friendly production. These include the implementation of supervised cover crops through directed grazing, soil sensorization for precise moisture control, and the use of drip irrigation to adjust water supply in each cycle. The optimization of water resources and soil care are part of the criteria the company uses to make agronomic decisions, as stated in its corporate information.

Technological innovation applied to agriculture occupies a central place in this approach. The use of drones to enhance pollination, the integration of high-efficiency irrigation systems, and continuous monitoring of tree conditions allow for reduced inputs and improved yields without compromising ecological standards. The precision agriculture approach directly connects with the sustainable development goals that shape the European agri-food agenda and positions the company as a player aligned with the responsibility and sustainability criteria demanded by investors and institutions.

The territorial dimension of the project also reinforces its role as a driver of local development. Sancorganic's activities generate direct and indirect employment in the municipalities of Valdetorres de Jarama and Cebreros, and whenever possible, the company works with local suppliers. Furthermore, the company has expressed its intention for its industrial facilities to become a reference point for other producers in the sector, fostering the consolidation of a competitive organic pistachio agro-industrial ecosystem in the face of international markets.

### **About Sancorganic**

Sancorganic is an agro-industrial producer of organic pistachios that combines scale, integration, and technical excellence. The company has a long-term business and industrial plan aiming to become the leader in the premium organic pistachio industry and to integrate the entire value chain of this product. Sancorganic developed its first plantation in Cebreros (Ávila) and has created one of the largest organic pistachio plantations in Europe in Valdetorres de Jarama (Madrid), covering 500 hectares that will accommodate up to 200,000 pistachio trees. This locality also houses its processing plant, which will integrate all activities of the pistachio production process: from tree to final product. Sancorganic's goal is to produce organic pistachios of the highest quality, leading production in Spain and Europe. Sancorganic is a company belonging to the Sancor Capital group.
