

# What is a Zipline? 

It's an attraction, an amusement park, a challenge to ourselves.

In Australia they're known as "Flying Foxes", in the UK as "Aerial Runways", the South Africans call them "Foofy Slides" and in Italian-speaking Switzerland they're "Tirolesi". An old-fashioned name might be "Cableways".

We call them Ziplines, as they do in the USA and in most of the world.

It consists of riding down one or more cables and, thanks to gravity it's possible to experience the thrill of flight.It involves a load-bearing cable connecting two points at different heights. Riders are fitted with a harness.

Our Ziplines are true amusement parks, the perfect attraction for tourism, combining a thrilling adventure with a unique way of sight-seeing in a location.

# There are many solutions for any location. 

## Zipline Possibilities:

## Trail

Unique line

Consecutive lines

Number of lines

Single line
Parallel lines

Type of flight

Standard Flight with carabiner

Standar flight with Directional Device

Horizontal Flight

Seated Flight

# How a zipline is made 

## A few info.

## How is the right location made?

Where a Zipline can be built?
What is the recommended drop between
take-off and landing area?
How long can the cable be?
What is the recommended slope?
What is the shape of a Zipline?
How much the zipline can be tensioned?

Everything depends on the terrain morphology and on the distance in-between take-off and landing area.

For each length there is a minimum and a maximum drop to be feasible.

A zipline consists of a cable attached at two points. The line forms a downward catenary. It is not a straight line connecting the start to the finish. The ground must keep this space free so that the rope does not collide with it.

*Very important*
A very long Zipline requires a much higher slope than a half-length line.
For example, a 500 meters long Zipline has a minimum drop of 30 meters to be feasible. Whereas a $1000(500 \times 2)$ meters long Zipline needs a minimum drop of 110 meters. Much more than 60 (30x2) meters!

If the slope is too low, the cable will break under high tension.

If too loose, you can stop halfway through.

If so, it will be necessary to brake the flight very much to avoid the collision at the end. If there is a very steep cable, the descent will be too slow and not so fun.

A perfect Zipline has a perfect configuration. If too tight, the descent becomes uncontrolled and should be braked.

The start is usually very steep. The landing is almost horizontal.

## Slopechart

Find your line.

Please find attached the range where a zipline is feasible.

| SPAN |  | DROP |  | MEDIUM SLOPE |  |  | MINIMUM INITIAL SLOPE |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| span length | min. drop | ideal drop | max. <br> drop | with <br> min. <br> drop | with ideal. drop | with max. drop | with <br> min. <br> slope | with ideal. slope | with max. slope |
| m | m | m | m | \% | \% | \% | \% | \% | \% |
| 100 | 3 | 6 | 8 | 3.00\% | 5.50\% | 8.00\% | 7.62\% | 14.68\% | 21.74\% |
