

CONTROL STARTS HERE

Built for Side Tipper Fleets

CONTROL

Most fleet owners aren't short on data. They're short on knowing it in time. Cashflow gets reconciled once the month's already gone. A wasted kilometre shows up in the fuel bill, not the moment it happened. A load's value is known eventually, not right now. TMS Dynamics ties trucks, trips, loads, and invoices into one live view so what's owed, what's wasted, and what's happening on the road today is visible today, not discovered later. That's the difference between running a fleet and being run by one.

5000 +

Trucks under management

LIVE VS PLANNED

TMS Dynamics uses AI to show you what has happened and where it might've gone wrong.

Every trip begins with a plan, but profitability depends on how closely reality follows it. TMS Dynamics gives side tipper operators a live comparison of planned versus actual trips, highlighting delayed vehicles, route deviations, and unplanned trucks as they happen so your team can respond before small issues become costly disruptions.

With real-time visibility into every truck, load, and trip value, you always know what's happening across your operation. Whether reducing wasted kilometres, improving fleet utilisation, or keeping deliveries on schedule, every decision is backed by live operational data instead of yesterday's reports.

OPERATIONS & PARTNERSHIP

A system only works if the people running it were part of building it. This is where we get involved.

Technology only creates value when it fits the way your business operates. That's why TMS Dynamics works alongside your team to build processes around your operation, giving you greater control over drivers, vehicles, compliance, and daily fleet performance without adding unnecessary complexity.

From system-generated driver timesheets and proactive document expiry management to real-time KPI dashboards, subcontractor fleet visibility, workshop servicing, standing time monitoring, RTMS compliance, and diesel management, every part of the operation is connected. The result is one platform that gives side tipper businesses complete operational control, improves efficiency, and helps reduce unnecessary costs across the fleet.

CONTROL

Before you look at software, look at your operation. These are the questions we ask every owner before we build anything.

01 Do you want to improve the transparency in your cashflow?

Every load, trip, and invoice tied together in one place. What's owed and what's outstanding visible today, not reconciled once the month has closed.

02 Do you want to be able to track wasted kilometers in your business?

Every kilometre measured against the trip it was meant for. Wasted distance surfaces immediately, not buried in a fuel bill at month-end.

03 Do you want full control over your operations?

Trucks, trips, drivers, and documents in a single view, built around how the operation already runs not a template forced onto it.

04 Do you want real-time updates on load and trip values, so you can act on what's happening right now?

Know what's on the truck, what it's worth, and where it is, the moment it changes. Decisions made on now, not on last week.

COST & PBS SUPPORT

This is where control turns into margin.

Would you like to control your diesel better and cut usage by up to **10%**?

Fuel is one of the biggest line items in any tipper operation and one of the easiest to lose control of. TMS Dynamics tracks every litre against the trip, load, and driver it was used for, so wastage is exposed instead of written off as the cost of doing business. Operators running on the platform have cut diesel consumption by up to 10%, simply by being able to track kilometres that are not planned for.

PBS Heavy Loader Support

TMS supports specific metrics for PBS trucks and shows these metrics separately to your normal trucks. These metrics are different from the normal side tipper metrics as PBS trucks have more compliancy issues that need to be tracked by law. TMS makes this process seamless.

04

05

TRIP INTELLIGENCE

TMS Dynamics uses AI to show you what has happened and where it might've gone wrong.

05 Would you like to see when a truck is behind schedule compared to its planned trip?

See when a truck falls behind schedule the moment it happens, giving your team time to respond before delays impact deliveries and profitability.

06 Would you like to see if a truck has deviated from its planned trip?

Know immediately when a truck leaves its planned route, allowing you to investigate issues, reduce unnecessary kilometres, and maintain operational control.

07 Would you like to control standing time, so no time is wasted onsite?

TMS tracks standing time on site in real time, so you can see the moment a truck overshoots an agreed standing time and act on it before it costs you.

08 Would you like to see when a truck isn't planned properly for the day?

Driver activity automatically generates accurate timesheets directly from the truck, removing manual calculations and simplifying payroll with information you can trust.

OPERATIONAL CONTROL

A system only works if the people running it were part of building it. This is where we get involved.

09 Would you like to pay drivers seamlessly, with a system-generated timesheet tracked while the driver is on the truck?

Hours worked, tracked from the truck itself. A timesheet nobody has to argue about, and a payroll run that doesn't take a full day.

10 Would you like to effectively manage your subbie trucks?

Subcontracted trucks brought into the same operational view as your own fleet same tracking, same checks, no exceptions.

11 Would you like to control document expiry dates, so paperwork is in order before a driver is planned on a truck?

TMS tracks every critical document driver's licence, PDP, passport, and vehicle paperwork and notifies you well in advance of expiry, so nothing lapses unnoticed. It's the difference between resolving a driver's paperwork at the yard and finding out at the border that a passport has expired, with a truck stuck and a queue building behind it.

12 Would you like to see all the KPI metrics you define, managed in real time?

Your business, your metrics not a template dashboard. Built around what actually matters to how you run your fleet.

COMPLIANCE & COST

This is where control turns into margin.

13

Do you want to automate your RTMS compliance?

TMS comes with a full set of pre-built, automated reports designed around RTMS compliance requirements. Route, load, and vehicle records are captured automatically as your trucks run, so the reporting is ready when you need it, not reconstructed after the fact.

14

Do you want better control in your workshop for truck servicing?

Services and inspections scheduled against every truck, so it goes down for planned maintenance not because nobody saw it coming.
