CERTIFICATE OF CYBERSECURITY ASSURANCE

FICTIONAL CERTIFICATE FOR TEMPLATE DEMONSTRATION

This certificate is presented to

Hexons

Enterprise zero trust readiness

This fictional certificate recognizes Hexons for completing a mock cybersecurity assurance review focused on protecting access to business systems, cloud platforms, internal applications, and partner workspaces through zero trust security principles.

The review scope included identity governance, role-based access, multi-factor authentication practices, privileged account handling, device trust, session control, and continuous verification of user and system activity.

For clients and partners, this certificate serves as a trust signal that cybersecurity is treated as an operational priority. It shows that access to sensitive systems is designed around verification, least privilege, and controlled exposure rather than broad default trust.

Issued on

February 14, 2024

Category: Identity & Access Security
